

DIGITAL LEARNING EXPERIENCE

Probability & Statistics Mini Project

Prepared By: Asiya Khan

1. Introduction

Digital learning has become an important part of education. Students use digital platforms such as YouTube, Google Classroom and Zoom to learn new concepts, improve their skills and access educational resources.

Our project, “Digital Learning Experience,” focuses on understanding how students use digital learning platforms and the challenges they face. We also wanted to know whether digital learning helps students understand academic subjects and whether they are satisfied with their overall experience.

2. Problem Statement

Although digital learning provides students with easy access to educational resources, it also has certain challenges. Students may face distractions, internet connectivity problems and difficulties communicating with teachers and classmates.

The main problem addressed in this project is to understand students’ experiences with digital learning, identify the difficulties they face and examine how effective they find it.

3. Objectives

1. To identify the different digital platforms used by students for learning, skill development, entertainment and personal interests.
2. To identify the major challenges and barriers faced by students while using digital learning methods.
3. To analyse the effectiveness of digital learning in improving students’ understanding and academic performance.
4. To examine students’ satisfaction and overall experience with digital learning.

4. Methodology

For this project, we collected responses from students through a survey questionnaire about their digital learning experiences. The questionnaire included questions about the platforms they use, their purposes for using them, the challenges they face, the effectiveness of digital learning and their overall satisfaction.

The collected responses were organized and analysed using statistical methods. We used graphs and charts to present the survey results and make comparisons easier. A dashboard was also prepared to display the important findings in a clear and understandable way.

5. Tools Used

- Google Forms: To collect students’ responses through a survey.
- Microsoft Excel: To organize the collected data, calculate frequencies and percentages, and prepare charts and graphs.
- Microsoft PowerPoint: To present the project objectives, analysis, interpretations and conclusions.

DIGITAL LEARNING EXPERIENCE

6. Results and Findings

The survey results provided useful information about students' digital learning experiences.

- **Digital platforms:** YouTube was the most preferred platform among the surveyed students. Google Classroom and Zoom/Google Meet had comparatively lower usage.
- **Purpose of use:** Academic learning was the primary purpose of using digital platforms, followed by career and professional skill development.
- **Challenges:** Distraction was the most commonly reported challenge, closely followed by internet and technical issues.
- **Effectiveness:** Most students agreed that digital learning allows them to learn at their own pace and improves their understanding of academic subjects.
- **Satisfaction:** The average satisfaction score was 3.66 out of 5, indicating a moderate-to-positive digital learning experience.
- **Communication:** More than half of the students reported moderate difficulty communicating with teachers and classmates during digital learning.

7. Conclusion

The project helped us understand students' experiences with digital learning. The findings show that students mainly use digital platforms for academic learning and skill development. They also find digital learning useful because it allows them to learn at their own pace and helps them understand academic concepts.

However, distractions, internet problems and communication difficulties remain important challenges. The average satisfaction score of 3.66 out of 5 indicates that students generally have a moderate-to-positive experience with digital learning.

Overall, digital learning is useful for students, but improvements in internet access, concentration and communication could make the experience better.

8. Future Scope

In the future, the survey could include more students from different courses and academic years. Further analysis could also explore the relationship between digital learning and students' actual academic performance. This would help us understand the effectiveness of digital learning in greater detail.
